

Business Problem

A mobile puzzle game company has released multiple app versions over time, introducing gameplay adjustments and monetization updates. However, the business lacks clear insights into how these changes have affected player engagement and revenue.

The Product team wants to determine whether newer versions have successfully improved player progression, retention, and monetization, while identifying gameplay bottlenecks that may lead to player churn.

As a Data Analyst, your task is to analyze player behavior, gameplay performance, and monetization metrics to uncover actionable insights and recommend data-driven strategies for improving the game's overall performance.

Business Question:

“Which app version performs best in terms of player engagement, gameplay progression, and monetization, and what product improvements can be implemented to increase retention and revenue?”
